DR. BABASAHEB AMBEDKAR TECHNOLOGICAL UNIVERSITY, LONERE Semester Examination – MAY - 2019

Sem.: IV Branch: SY Mechanical Engineering Subject with Subject Code: SOM (BTMEC403) Marks: 60 Time: 3 Hr.

Date: 20-05-2019

Instructions to the Students

1. Each question carries 12 marks.

- 2. Attempt any five questions of the following.
- 3. Illustrate your answers with neat sketches, diagram etc., wherever necessary.
- 4. If some part or parameter is noticed to be missing, you may appropriately assume it and should mention it clearly

(Marks)

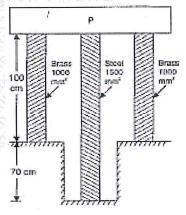

Q.1. a) Define the following terms

- i) Young's Modulus
- ii) Modulus of Rigidity
- iii) Poisson's ratio
- iv) Factor of safety
- v) Hook's law

(05)

LIBRAR

b) Two brass rods and one steel rod together support a load as shown in Fig below. If the stresses in brass and steel are not to exceed 60 N/mm² and 120N/mm^2 , find the safe load that can be supported .Take E for steel = 2 x 10^5 N/mm^2 and for brass = 1 x 10⁵ N/mm². The cross sectional area of steed rod is 1500 mm² and of each brass rod is 1000 mm². (07)

OR

b) A steel rod of 3 cm diameter is enclosed centrally in a hollow copper tube of external diameter 5 cm and internal diameter of 4 cm. The composite bar is then subjected to an axial pull of 45000 N. If the length of each par is equal to 15 cm. Determine:

- i) The stresses in the rod and tube.
- ii) Load carried by each bar.

(07)

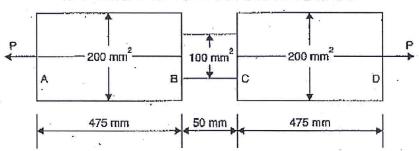

Q.2. a) Prove that stress induced in a body when the load is applied with the impact is given by

$$\sigma = \frac{P}{A} \left(1 + \sqrt{1 + \frac{2AEh}{P \cdot L}} \right)$$

where P = Load applied with impact, A = Cross-sectional area of the body, h = height through which load falls, L = Length of the body, and E = Modulus of elasticity. (06)

OR

a) The maximum stress produced by a pull in a bar of length 1 m is 150 N/mm². The area of cross-sections and length are shown in Fig. Calculate the strain energy stored in the bar if $E = 2 \times 10^5 \text{ N/mm}^2$. (06)

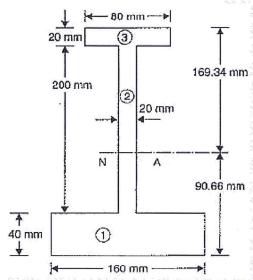

- **b)** The stresses at a point in a bar are 200 N/mm² (tensile) and 100 N/mm² (compressive). Determine the resultant stress in magnitude and direction on a plane inclined at 60° to the axis of the major stress. Also determine the maximum intensity of shear stress in the material at the point. **(06)**
- Q.3. a) A hollow rectangular section is having external size 500 mm x 450 mm internal size 400 mm x 350 mm. It carries a vertical load of 100 kN at outer edge of the column on X-axis. Calculate maximum and minimum intensities of stresses in the section. Assume 500 mm side horizontal. (06)
 - **b)** Draw the shear force and bending moment (B.M.) diagram for a simply supported beam of length 9 m and carrying a uniformly distributed load of 10 kN/m for a distance of 6 m from the left end. Also calculate the maximum B.M. on the section.

(06)

Q.4. A cast iron beam is of I-section as shown in Fig. The beam is simply supported on a span of 5 m. If the tensile stress is not to exceed 20 N/mm², Find the safe uniformly load which the beam can carry. Find also the maximum compressive stress.

Q.5. a) A cantilever of length 3 m carries a point load of 10 kN at a distance of 2 m from the fixed end. If $E = 2 \times 10^5 \text{ N/mm}^2$ and $I = 10^8 \text{ mm}^4$, find the slope and deflection at the free end using conjugate beam method. (05)

OR

- a) A cantilever of length 2 m carries a point load of 20 kN at the free end and another load of 20 kN at its center. If $E = 10^5$ N/mm² and $I = 10^8$ mm⁴ for the cantilever then determine by moment area method, the slope and deflection of the cantilever at the free end. (05)
- **b)** A cantilever of length 2 m carries a uniformly distributed load 2 kN/m over a length of 1 m from the free end, and a point load of 1 kN at the free end. Find the slope and deflection at the free end if $E = 2.1 \times 10^5 \text{ N/mm}^2$ and $I = 6.667 \times 10^7 \text{ mm}^4$.

(07)

Q.6. a) Derive the relation for a circular shaft when subjected to torsion as given below

$$\frac{T}{J} = \frac{\tau}{R} = \frac{C\theta}{L}$$

where T = Torque transmitted,

undefined

J = Polar moment of inertia,

 τ = Max. Shear stress,

R= Radius of the shaft,

C = Modulus rigidity,

 θ = Angle of twist, and

L = Length of the shaft.

(06)

b) A hollow shaft, having an inside diameter 60% of its outer diameter, is to replace a solid shaft transmitting the same power at the same speed. Calculate the percentage saving in material, if the material to be used is also the same.

(06)

OR

b) A solid round bar 4 m long and 5 cm in diameter was found to extend 4.6 mm under a tensile load of 50 kN. This bar is used as a strut with both ends hinged. Determine the buckling load for the bar and also the safe load taking factor of safety as 4. (06)
